

POCKET DOOR EZ-CLOSER INSTALLATION INSTRUCTIONS

Flush Doors: With the door dismounted, measure and find the **centre on the back edge of the door**.

IMPORTANT: For doors with glass, molded passages or any other non-flush door you might need to off-set the location of the hole for installation of the *EZ-Closer*. Before drilling ensure that there is sufficient width and depth to drill a 1.0 inch wide hole 3.75 inches deep without damaging the door. See installation tips 1 and 2, below.

Using a **1 inch spade bit**, bore a hole to the depth of **3.75 inches** (the length of the *EZ-Closer* cylinder). Firmly push the *EZ-Closer* into the drilled hole and secure with the two screws provided (screws must be counter sunk). Now your door is ready to be fitted.

The *EZ-Closer* should sit on the back edge of the door. **DO NOT** mortise the flange into the back of the door.

Ensure that there is **no object between the back of the door** and the back stud inside the pocket, which would prohibit the plunger on the *EZ-Closer* from being fully depressed (see diagram). The pocket back stud and back edge of door must be plumb allowing the gap between door and back stud to be parallel.

Failure to do this could affect the smooth and positive feel of the *Jexis* action. Pocket Doors with the *EZ-Closer* installed **do not need the bumper** (remove the bumper at the end of cavity if already installed).

INSTALLATION TIPS

- 1) For smooth operation do not install the *EZ-Closer* near the top or bottom edge of the door. The door must NOT tilt when pushed to release from the cavity.
- 2) For non-flush doors an alternative installation option is to install the *EZ-Closer* in the pocket back stud.
- 3) If the door is slightly undersize in relation to the pocket: place enough washers (packers) between the *EZ-Closer* faceplate and the back edge of the door, until the front edge of the door is flush with the opening Jamb.
